
System Engineer 8 v1.0.10.0**Release Date: May 1st, 2025****Overview**

This update includes various stability improvements, bug fixes, and compliance updates. Key areas include enhanced error handling, better preset and EQ tools, OEM support updates, and essential GDPR compliance fixes.

Highlights

- Improved Stability & Error Handling
- Resolved multiple crash scenarios, including null references, unhandled task exceptions, and device synchronisation issues.
- Improved exception reporting.

Preset & EQ Enhancements

- Added support for copy/paste of EQ settings and toggling.
- Prevented editing or pasting into hidden or read-only fields.
- Dragging presets from read-only libraries is now supported (without modifying the source).

Device Communication Fixes

- Fixed various sync and memory-copy issues that could affect startup or live device interaction.
- Improved feedback for devices reporting unexpected or null controller data.

UI & Workflow Improvements

- Disabled or read-only fields now behave correctly in multi-select scenarios.
- Navigation, toolbar state, and control feedback in Tune View have been refined.

GDPR Compliance Updates

- Resolved multiple areas where user-identifiable information could be exposed in logs or file paths.

Expanded OEM Support

- Added support for new OEM customers.
- Improved OEM ID validation for better device recognition.
